The Goldman Sachs Group, Inc.

2017 Mid-Cycle Dodd-Frank Act Stress Test Disclosure

October 2017
Overview and Requirements

For the mid-cycle U.S. Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank Act) Stress Test (Mid-Cycle DFAST) completed in October of each year, The Goldman Sachs Group, Inc. (referred to herein as “Group Inc.,” “we,” “our,” “us” or “the firm”) is required to conduct stress tests using a set of internally developed macroeconomic scenarios (internal baseline, internal adverse and internal severely adverse).

Stress testing is an integral component of our internal processes to assess our capital adequacy and to ensure that the firm holds an appropriate amount of capital relative to the risks of our businesses.

The 2017 Mid-Cycle DFAST is not conducted under the Board of Governors of the Federal Reserve System’s (Federal Reserve Board) Capital Plan Rule and is not part of the annual Comprehensive Capital Analysis and Review (CCAR) process. Accordingly, the Federal Reserve Board does not provide an objection or non-objection to an institution’s Mid-Cycle DFAST results. Firms are required, however, to conduct the Mid-Cycle DFAST in accordance with the requirements of the Federal Reserve Board’s DFAST rules.

We are required to calculate our 2017 Mid-Cycle DFAST results reflecting certain aspects of the Federal Reserve Board’s revised risk-based capital and leverage regulations, subject to certain transitional provisions (Revised Capital Framework). These regulations are largely based on the Basel Committee on Banking Supervision’s final capital framework for strengthening international capital standards (Basel III) and also implement certain provisions of the Dodd-Frank Act. The risk-based capital requirements are expressed as capital ratios that compare measures of regulatory capital to risk-weighted assets (RWAs).

The firm is required to calculate Common Equity Tier 1 (CET1), Tier 1 capital and Total capital ratios for all quarters of the planning horizon in accordance with the Standardized approach and market risk rules set out in the Revised Capital Framework (together, the Standardized Capital Rules). We are also required to calculate a Tier 1 leverage ratio for all quarters, using the Revised Capital Framework definition of Tier 1 capital in the numerator and adjusted total assets (which includes adjustments for certain capital deductions) in the denominator. The firm is also required to calculate a supplementary leverage ratio (SLR) for the first quarter of 2018 through the third quarter of 2019. The SLR compares Tier 1 capital to a measure of leverage exposure, which consists of total assets for the quarter and certain off-balance-sheet exposures (which include a measure of derivatives exposures, securities financing transactions and commitments), less certain balance sheet deductions.

The planning horizon for the 2017 Mid-Cycle DFAST is the third quarter of 2017 through and including the third quarter of 2019.

Minimum Regulatory Capital Ratio Requirements

The table below presents the required minimum capital ratios for the firm over the planning horizon in the stress test. For the 2017 Mid-Cycle DFAST, the firm is only subject to the SLR minimum from the first quarter of 2018 to the third quarter of 2019.

Overview and Description of Group Inc.’s Severely Adverse Scenario

The firm’s nine-quarter internally developed severely adverse scenario is characterized by a stressed global macroeconomic environment, including severe recessions in the U.S., Eurozone, U.K. and Japan and an economic slowdown in developing Asia. The scenario begins with a global market shock, which is a repricing of our trading and counterparty exposures. In addition to the global market shock, we include the impact of the default of a large counterparty during the first quarter of the planning horizon. The planning horizon includes a decline in gross domestic product (real GDP), a rising rate of unemployment, a low interest rate environment, declining asset values and widening credit spreads across global economic regions. This is followed by a slow and partial recovery. We also incorporate a firm-specific event, which further reduces our franchise revenues.

In this scenario, we project variables across a range of macroeconomic indicators and asset classes that management determines are necessary to produce revenues, expenses, balance sheet and RWA projections. For example:

GDP and Unemployment. U.S. real GDP declines 5.4% over the first five quarters of the planning horizon. From the trough in the third quarter of 2018, U.S. real GDP experiences growth of approximately 1.5% over the remainder of the planning horizon. The U.S. unemployment rate increases from 4.3% in the second quarter of 2017 to a peak of 10.1% in the first quarter of 2019.

Equity Markets and Volatility. Equity market indices experience sharp declines over the first five quarters of the planning horizon, with the S&P 500 Index decreasing 53% by the third quarter of 2018. The VIX Index increases from 16 to a peak of 82 in the first quarter of 2018. The S&P 500 Index partially recovers over the remainder of the planning horizon, ending 16% below the second quarter of 2017 starting point. The VIX Index gradually decreases to 30 over the remainder of the planning horizon.

U.S. Interest Rates and Credit Spreads. The 3-month Treasury (UST) yield declines to approximately 10 basis points by the third quarter of 2018 and remains at that level through the second quarter of 2019 before beginning to recover. Additionally, the 10-year UST yield decreases by approximately 125 basis points to its trough in the third quarter of 2018 and stays at that level through the first quarter of 2019 before beginning to recover. By the third quarter of 2018, U.S. investment-grade credit spreads widen by approximately 150 basis points above the second quarter of 2017 starting point and by the third quarter of 2018, U.S. high yield spreads widen by approximately 900 basis points. U.S. investment-grade and U.S. high yield spreads gradually contract over the remainder of the planning horizon, though they still remain higher than their second quarter of 2017 starting points.

Similarly, international economies experience declines in real GDP and equity markets, as well as widening credit spreads.

Given the extensive use of fair value accounting in our balance sheet, we believe the inclusion of a global market shock is a meaningful way for us to stress our risks and exposures as significant and rapid changes in asset values are particularly impactful to our capital position. We choose a shock that we believe captures, and appropriately stresses, our material risk positions. Furthermore, as the scenario includes a severely adverse operating environment, characterized by further market deterioration in global asset values and a firm-specific event, we believe the scenario captures our idiosyncratic risks and significantly stresses our capital position. We believe our severely adverse scenario represents a low probability, but high impact scenario, though it does not reflect our forecast of likely macroeconomic conditions over the planning horizon.
Summary of Results

The table below presents the results of the firm’s calculations under our severely adverse scenario over the planning horizon, including the instantaneous global market shock and counterparty default scenario applied to our trading and counterparty exposures, respectively.

These results incorporate the following capital action assumptions, as prescribed by the Federal Reserve Board’s DFAST rules:

- Actual capital actions for the third quarter of 2017; and
- For each of the remaining quarters in the planning horizon:
  - common stock dividends equal to the quarterly average dollar amount of common stock dividends that were paid in the fourth quarter of 2016 through and including the third quarter of 2017; and
  - payments on any other instrument that is eligible for inclusion in the numerator of a regulatory capital ratio equal to the stated dividend, interest, or principal due on such instrument during the quarter.

Based on the firm’s severely adverse scenario, the most significant drivers of the firm’s capital ratios over the planning horizon are:

- Trading and counterparty losses, which include the global market shock, the counterparty default scenario, and trading and counterparty credit incremental default risk losses, are included in our net (loss)/income projections;
- Lower Pre-Provision Net Revenues (PPNR) primarily due to decreased revenues and increased operational risk losses;
- Increased provisions and other losses in our loans and lending commitments; and
- Further transition towards the fully phased in Standardized Capital Rules, as applicable.

These 2017 Mid-Cycle DFAST results are prepared based on our internal stress testing methodology and our internally developed severely adverse scenario and therefore will not be comparable to the 2017 Annual DFAST results for the firm’s calculations based on the Federal Reserve Board’s supervisory severely adverse scenario and instructions.
2017 Mid-Cycle DFAST Results
Projected Capital Ratios, RWAs, Pre-Provision Net Revenues (PPNR), Losses, Net (Loss)/Income Before Taxes and Loan Losses
The Goldman Sachs Group, Inc. Estimates in our Severely Adverse Scenario

These results are calculated using capital action assumptions required by the DFAST rules. All projections represent hypothetical estimates that involve an economic outcome that is more adverse than expected. These estimates are not forecasts.

Actual Q2 2017 and Projected Capital Ratios through Q3 2019 under our Severely Adverse Scenario

<table>
<thead>
<tr>
<th>Regulatory Ratio</th>
<th>Actual Q2 2017</th>
<th>Projected Stressed Capital Ratios</th>
<th>Minimum</th>
</tr>

<td>6.3</td>
<td>4.5</td>
<td>4.3</td>
</tr>
</tbody>
</table>

In the above table, CET1, Tier 1 capital and Total capital are calculated under the Standardized Capital Rules, subject to transitional provisions. The lowest calculated capital ratios (minimum) from the third quarter of 2017 to the third quarter of 2019 are presented in the table. For the SLR, the lowest calculated ratio (minimum) from the first quarter of 2018 to the third quarter of 2019 is presented in the table.

Projected Loan Losses by Type of Loan from Q3 2017 through Q3 2019 under our Severely Adverse Scenario

<table>
<thead>
<tr>
<th>Loan Type</th>
<th>$ in billions</th>
<th>Portfolio Loss Rates (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loan Losses</td>
<td>$4.5</td>
<td>5.8%</td>

</tr>
<tr>
<td>Other Consumer</td>
<td>0.5</td>
<td>9.7</td>
</tr>
<tr>
<td>Other Loans</td>
<td>1.3</td>
<td>3.3</td>
</tr>
</tbody>
</table>

In the table above:
- Loan losses and average loan balances used to calculate portfolio loss rates exclude loans and lending commitments accounted for under the fair value option.
- Consistent with the Federal Reserve’s methodology, incremental provisions taken on the firm’s purchased credit-impaired (PCI) portfolios are included as part of loan losses. The provisions are also included in provision for loan losses. Previously, the firm only included these provisions in provision for loan losses.

Projected PPNR, Losses and Net (Loss)/Income Before Taxes from Q3 2017 through Q3 2019 under our Severely Adverse Scenario

<table>
<thead>
<tr>
<th>Item</th>
<th>$ in billions</th>

<td>$(24.1)</td>
<td>(2.8)%</td>
</tr>
</tbody>
</table>

In the table above:
- PPNR includes net revenues (revenues) and operating expenses (including operational risk events and other real estate owned costs).
- Trading and counterparty losses include mark-to-market losses, trading and counterparty credit incremental default risk losses on positions held at fair value and changes in credit valuation adjustment (CVA) as a result of the global market shock and the impact of the counterparty default scenario. Subsequent trading and counterparty credit incremental default risk losses over the planning horizon are also included.
- Other losses/(gains) primarily reflects the impact of the global market shock on certain loans and lending commitments and associated hedges accounted for under the fair value option, as well as the projected change in fair value of these loans and lending commitments based on our severity adverse scenario.
Material Risks Captured in the Stress Test

Market Risk
Market risk is the risk of loss in the value of our inventory, as well as certain other financial assets and financial liabilities, due to changes in market conditions. We employ a variety of risk measures to monitor market risk. We hold inventory primarily for market making for our clients and for our investing and lending activities. Our inventory therefore changes based on client demands and our investment opportunities. Categories of market risk include the following:

- Interest rate risk: results from exposures to changes in the level, slope and curvature of yield curves, the volatilities of interest rates, prepayment speeds and credit spreads;
- Equity price risk: results from exposures to changes in prices and volatilities of individual equities, baskets of equities and equity indices;
- Currency rate risk: results from exposures to changes in spot prices, forward prices and volatilities of currency rates; and
- Commodity price risk: results from exposures to changes in spot prices, forward prices and volatilities of commodities, such as crude oil, petroleum products, natural gas, electricity, and precious and base metals.

Market risk is incorporated into our 2017 Mid-Cycle DFAST results via the global market shock and the severely adverse macroeconomic scenario. The global market shock is applied to our fair value positions with changes in the fair value being reflected in our revenue projections in the first quarter of the planning horizon.

In addition to the global market shock, trading incremental default risk losses are estimated over the planning horizon.

We further stress our positions based on the changes in macroeconomic variables and asset values over the planning horizon of our internally developed severely adverse scenario.

Credit Risk
Credit risk represents the potential for loss due to the default or deterioration in credit quality of a counterparty (e.g., an over-the-counter (OTC) derivatives counterparty or a borrower) or an issuer of securities or other instruments we hold. Our exposure to credit risk comes mostly from client transactions in OTC derivatives and loans and lending commitments. Credit risk also comes from cash placed with banks, securities financing transactions (i.e., resale and repurchase agreements and securities borrowing and lending activities) and receivables from brokers, dealers, clearing organizations, customers and counterparties.

Credit risk is incorporated into our 2017 Mid-Cycle DFAST results via the global market shock, the counterparty default scenario and under the severely adverse macroeconomic scenario. The global market shock includes counterparty credit losses (i.e., from credit valuation adjustments (CVA)). The counterparty default scenario includes counterparty credit losses due to defaults on OTC derivative and securities financing transactions and the default of a large counterparty. The global market shock and the counterparty default scenario are both recognized in the first quarter of the planning horizon. Projections for CVA and incremental default risk over the planning horizon are also included to capture the impact of losses due to the change in counterparty credit quality and correlated defaults under our severely adverse macroeconomic scenario.

Credit risk is also incorporated into our projections for changes in provisions and loan losses in our loans held for investment that are accounted for at amortized cost, net of allowance, (loans receivable) and related lending commitments. We utilize a model that estimates losses based on projections of probability of default, loss given default, exposure at default, industry classification, region, and borrower ratings migration for loans receivable. We also include projections of estimated defaults and associated losses on our loans and lending commitments accounted for under the fair value option.
Operational Risk
Operational risk is the risk of loss resulting from inadequate or failed internal processes, people and systems or from external events. Our exposure to operational risk arises from routine processing errors as well as extraordinary incidents, such as major systems failures or legal and regulatory matters.

Potential types of loss events related to internal and external operational risk include:

- Clients, products and business practices;
- Execution, delivery and process management;
- Business disruption and system failures;
- Employment practices and workplace safety;
- Damage to physical assets;
- Internal fraud; and
- External fraud.

Operational risk, including litigation-related losses, is incorporated into our 2017 Mid-Cycle DFAST results with losses estimated based on the firm’s historical operational risk experience, relevant internal factors, including the firmwide risk and control self-assessment, scenario analysis, recent industry matters and the assumed conditions of the firm’s severely adverse scenario. Operational risk losses are included within non-compensation expense projections over the planning horizon.

Liquidity Risk
Liquidity risk is the risk that we will be unable to fund the firm or meet our liquidity needs in the event of firm-specific, broader industry, or market liquidity stress events. Liquidity is of critical importance to us, as most of the failures of financial institutions have occurred in large part due to insufficient liquidity. Accordingly, we have in place a comprehensive and conservative set of liquidity and funding policies. Our principal objective is to be able to fund the firm and to enable our core businesses to continue to serve clients and generate revenues, even under adverse circumstances.

For purposes of the 2017 Mid-Cycle DFAST, we analyzed how we would manage our balance sheet through the duration of a severe crisis and we included assumptions regarding our ability to access the secured and unsecured funding markets to generate incremental liquidity. Our 2017 Mid-Cycle DFAST results took certain liquidity risks into account by projecting potential liquidity outflows due to our severely adverse scenario environment (e.g., draws on unfunded commitments and secured and unsecured funding roll-offs without replacement) and the impact of these outflows on our liquidity position and balance sheet. Additionally, we project increased funding costs.

Description of Our Projection Methodologies

PPNR
PPNR includes revenues and operating expenses.

Revenues. We project revenues for each of our four business segments: Investment Banking, Institutional Client Services, Investing & Lending and Investment Management.

When projecting revenues for these four segments, we utilize multiple approaches, including models based on regression analyses, management judgment and projecting the impact of re-pricing inventory due to the projected changes in asset values under the firm’s severely adverse scenario. We also incorporate the impact of broader industry performance during historical stressed periods to help guide management judgment regarding our future performance in the assumed stressed operating environment. The projected revenues under the firm’s severely adverse scenario are an aggregation of projected revenues for each of these business segments.

Additionally, we incorporate an impact to our franchise revenues resulting from the assumed firm-specific event as referenced in the scenario overview and description section above. The inclusion of a firm-specific event in our severely adverse scenario projections inherently incorporates some level of management judgment, specifically regarding the ways in which the event impacts our projected results. When assessing the impact of the firm-specific event on our results, we leverage multiple approaches, including assumed reductions in trading revenues, investment banking market share and assets under supervision.
• **Investment Banking.** We provide a broad range of investment banking services to a diverse group of corporations, financial institutions, investment funds and governments. Services include strategic advisory assignments with respect to mergers and acquisitions, divestitures, corporate defense activities, restructurings, spin-offs and risk management, and debt and equity underwriting of public offerings and private placements, including local and cross-border transactions and acquisition financing, as well as derivative transactions directly related to these activities.

• **Institutional Client Services.** We facilitate client transactions and make markets in fixed income, equity, currency and commodity products, primarily with institutional clients such as corporations, financial institutions, investment funds and governments. We also make markets in and clear client transactions on major stock, options and futures exchanges worldwide and provide financing, securities lending and other prime brokerage services to institutional clients.

• **Investing & Lending.** We invest in and originate loans to provide financing to clients. These investments and loans are typically longer-term in nature. We make investments, some of which are consolidated, directly and indirectly through funds that we manage, in debt securities and loans, public and private equity securities, infrastructure and real estate entities. We also make unsecured loans to individuals through our online platform.

• **Investment Management.** We provide investment management services and offer investment products (primarily through separately managed accounts and commingled vehicles, such as mutual funds and private investment funds) across all major asset classes to a diverse set of institutional and individual clients. We also offer wealth advisory services, including portfolio management and financial counseling, and brokerage and other transaction services to high-net-worth individuals and families.

**Expenses.** Operating expense projections over the planning horizon include compensation and benefits and non-compensation expenses.

Compensation and benefits includes salaries, discretionary compensation, amortization of equity awards and other items such as benefits. Discretionary compensation is significantly impacted by, among other factors, the level of net revenues, overall financial performance, prevailing labor markets, business mix, the structure of our share-based compensation programs and the external environment.

Non-compensation expenses include certain expenses that vary with levels of business activity, such as brokerage, clearing, exchange and distribution fees and market development costs. Non-compensation expenses also include expenses that relate to our global footprint and overall headcount levels. Such expenses include depreciation and amortization, occupancy, and communication and technology costs.

In addition, non-compensation expenses include any projected impairments of nonfinancial assets as well as operational risk losses, including litigation reserves (and corresponding legal fees), cyber attack associated losses and fraud losses.

**Provisions and Loan Losses**
Provisions and loan losses are projected over the planning horizon using a comprehensive, model-based approach. The model estimates losses based on projections of probability of default, loss given default, exposure at default, industry classification, region and borrower ratings migration for loans receivable and lending commitments in the accrual portfolio.

**Trading and Counterparty Losses**
Trading and counterparty losses include mark-to-market losses, trading incremental default risk losses on positions held at fair value and changes in CVA as a result of the global market shock, as well as the impact of our counterparty default scenario. Subsequent trading and counterparty credit incremental default risk and counterparty losses over the planning horizon are also included. We use the firm’s existing stress testing and risk management infrastructure to calculate the impact of the global market shock and to quantify the impact of the counterparty default scenario as well as trading incremental default risk and counterparty losses over the planning horizon.
Other Losses
Other losses primarily includes projected changes over the planning horizon in the fair value of certain loans and lending commitments and associated hedges accounted for at fair value, which are subject to the global market shock as well as the projected change in the fair value of these loans and lending commitments based on our severely adverse scenario.

Balance Sheet
Balance sheet projections are based on the macroeconomic environment and incorporate input from businesses on growth assumptions and planned activity, changes to carrying values as a result of marking our inventory to market, as well as management judgment as to how the firm would manage its balance sheet, funding and liquidity over the planning horizon.

We include the impact of the global market shock into the firm’s balance sheet projections under our severely adverse scenario.

Capital and RWAs
Capital projections incorporate projected net earnings, capital deductions, other changes in equity, which includes the impact of actual capital actions from the third quarter of 2017, and assumed capital actions required by the DFAST rules. Projected RWAs reflect the impact of the macroeconomic environment; for example, changes in volatilities and credit spreads are incorporated into our calculation of projected RWAs. Additionally, projected RWAs and capital deductions are also impacted by the projected size and composition of our balance sheet over the planning horizon.

As noted above, we have calculated capital ratios under the Standardized Capital Rules, including transitional provisions where appropriate.
